# Project Report: Library Management System

## Introduction

This project aims to develop a web-based Library Management System using a combination of HTML, CSS, JavaScript for frontend development, PHP for server-side scripting, and MySQL for database management. The system consists of several key components: `index.php` as the home page providing navigation and user interaction, `borrow.php` for borrowing books, `return.php` for returning books, `books.php` for displaying available books, and `styles.css` for styling across all pages.

## Technologies Used

The frontend of the system utilizes HTML5 for structure, CSS3 for styling, and minimal JavaScript for interactivity. PHP is employed for server-side logic to handle database interactions and dynamic content generation. MySQL database is utilized via the XAMPP stack, providing a robust backend for storing and managing book information and user sessions.

## Detailed Description of Components

### `index.php` (Home Page)

The `index.php` serves as the gateway to the library system. It welcomes users, provides navigation links to other pages (`books.php`, `borrow.php`, `return.php`), and dynamically adjusts content based on user interactions or login status. It ensures a user-friendly interface with clear navigation and a visually appealing layout facilitated by `styles.css`.

### `borrow.php` (Borrow Book Page)

`borrow.php` enables users to borrow books from the library. It includes a form where users can input the ID of the book they wish to borrow. PHP scripting validates the input, updates the database to mark the book as borrowed (`status='borrowed'`), and provides feedback to the user on the success or failure of the operation.

### `return.php` (Return Book Page)

The `return.php` page allows users to return books they have borrowed. Similar to `borrow.php`, it features a form for entering the book ID to be returned. Upon submission, PHP logic verifies the ID, updates the database (`status='available'`), and informs the user about the completion status of the return process.

### **books.php (Display Books Page)**

books.php lists all available books in the library. It retrieves book details from the database using PHP MySQLi queries and dynamically populates a table on the webpage. Users can search for specific books by title, author, publication year, or status (available or borrowed), enhancing usability and accessibility.

### **styles.css**

styles.css defines the visual identity of the library system, ensuring a consistent and attractive user interface across all pages. It specifies fonts, colors, layout structures, and responsive design elements to optimize user experience and readability on different devices.

## **Conclusion**

In conclusion, this Library Management System project successfully integrates frontend and backend technologies to create a functional and user-friendly application. It addresses key functionalities such as book borrowing, returning, and browsing through a structured interface. While the current implementation provides core features, future enhancements could include user authentication, more advanced search options, and administrative controls for managing book inventory and user accounts.
